vFlexTtor® 1006.3 is a future proof scalable iSCSI storage and computing capacity model, it is energy-efficient solution ideal for space-constrained, mission-critical deployments.

iSCSI's advantages are that it runs over ubiquitous Ethernet networks and switches, can communicate over wide area as well as local area networks, and, because it runs on top of IP, it is an extremely flexible routed protocol that facilitates virtualization. IT Global Systems has invested in a broad range of iSCSI and computing solutions ranging from the entry-level vFlexTtor 500 series to the powerful vFlexTtor 1000 series and the massively scalable vFlexTtor 2000 series products.

According to Forrester<sup>1</sup>, there are both hard economic benefits as well as soft benefits in adopting iSCSI storage.

“Given the hardware acquisition cost benefits as well as synergies in network staff and infrastructure, significant benefits can be gained from the use of iSCSI-based SAN architectures.” Among the soft benefits is “more virtualization within the protocol. iSCSI is inherently more virtualized than Fibre Channel... allowing for more granular addressing, especially important for virtual server environments.” (Forrester Research, Inc., February 2008, “Cost Comparison of iSCSI Versus Fibre Channel SAN Components”<sup>1</sup>)

The applications require not only the inherent ease of use and accessibility of the iSCSI protocol, but the intelligent automation and dynamic virtualization such as those in the vFlexTtor architecture. While we can build your virtual infrastructure based on the vFlexTtor<sup>®</sup> computing and storage resources, vFlexTtor<sup>®</sup> still can be easily integrated within already existing computing environments.
